Research at experimental pharmacology

- Tools for novel therapeutic strategies to increase organ function during disease
- Gain insight in processes that determine renal excretion of metabolic wastes and drugs to develop interventions at end stage kidney disease

The kidney and its functions

Renal drug handling: translational challenges

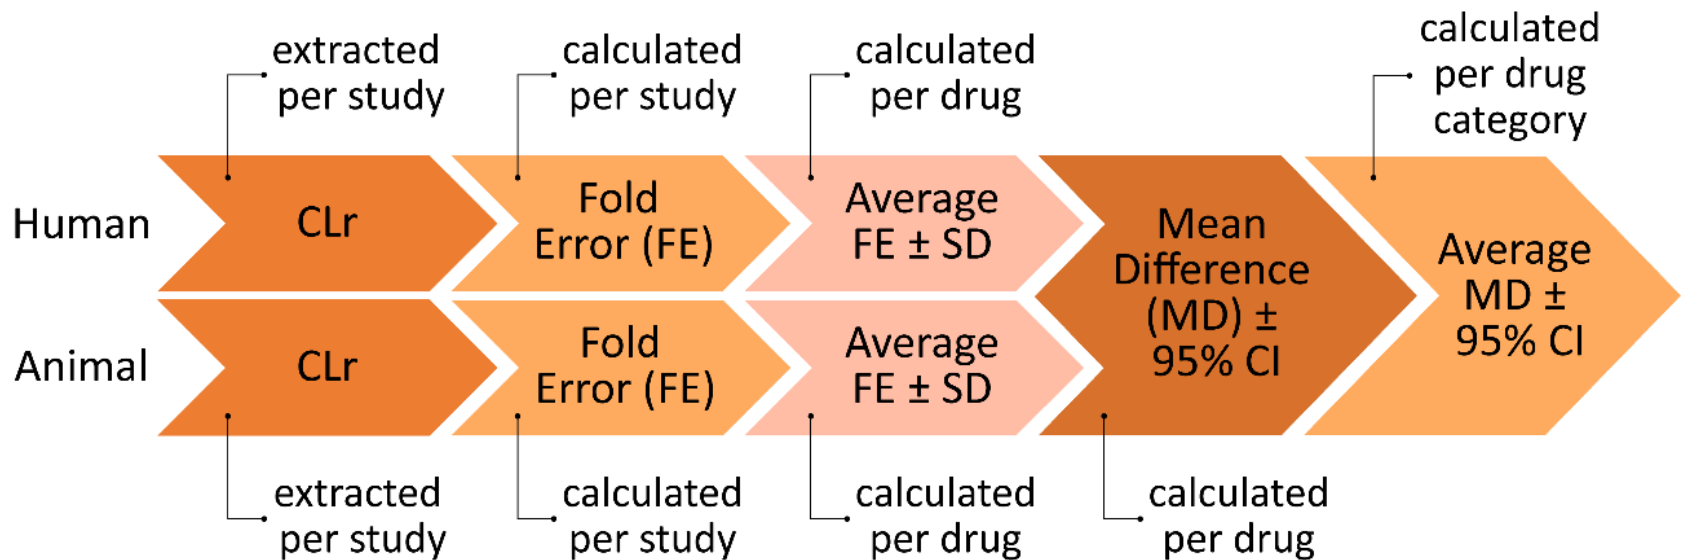

Artwork 'Youngman' by Tim Noble and Sue Webster, 2012

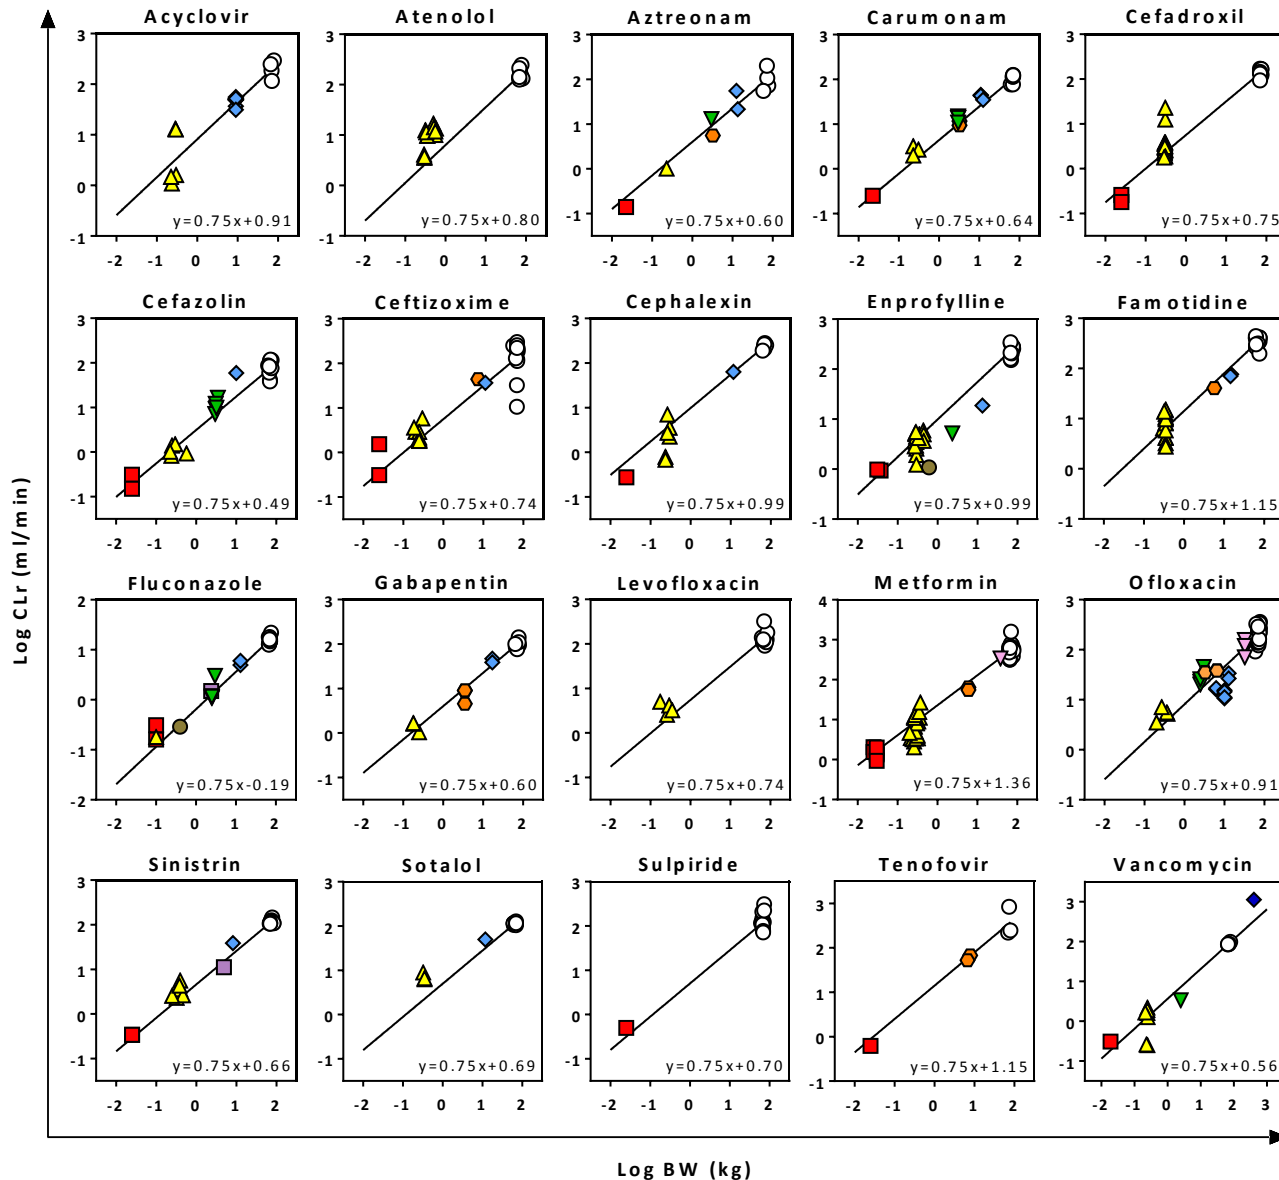

Humans are animals, but are animals human enough?

- Allometric scaling is suitable for prediction of human renal drug clearance (CL_r)

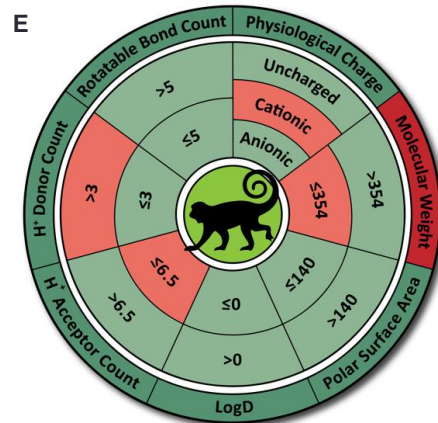

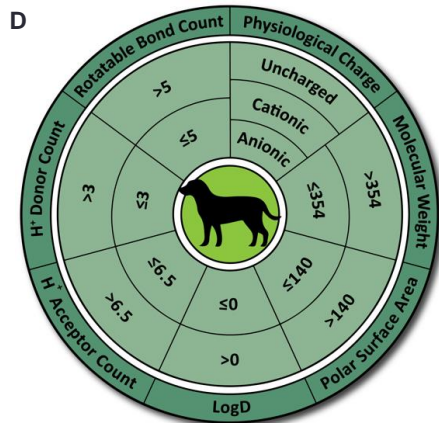

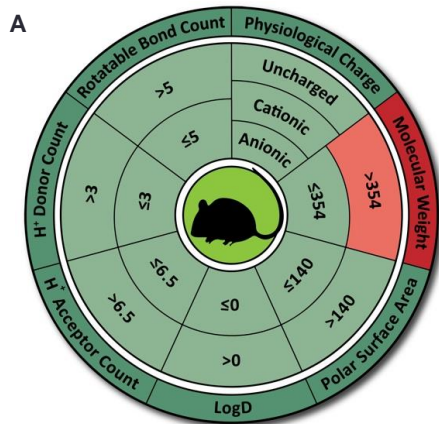

- The average CL_r of a diverse set of 20 drugs scales to the 3/4 power of body mass

Humans are animals, but are animals human enough?

Humans are animals, but are animals human enough?

F

	Net Filtration	Net Secretion
	Green	Green
	Green	Red
	Green	Green
	Red	Green
	Green	Green

- Rat models should be used with caution for drug disposition studies
- Meta-analyses of (pre)clinical data can reduce PK animal experiments

Renal drug handling: predictional challenges

- **Increasing complexity** reduces reproducibility and through-put analysis
- **Increasing complexity** increases predictivity and physiological relevance, but also costs and manipulation

Advanced *in vitro* models: bioengineered kidney tubules

Bioengineering kidney tubules

Conditionally Immortalized Proximal Tubular Epithelial Cell (ciPTEC)

■ Immortalization:

1. SV40T tsA58 U19
2. hTERT

Bioengineering kidney tubules: membranes

Collagen IV

L-Dopa

Coated membrane

Uncoated membrane

Bioengineering kidney tubules

- ZO-1
- Nucleus
- OCT2

Bioengineered kidney tubules

Bioengineered kidney tubules in microfluidics

Bioengineered kidney tubules: indoxyl sulfate excretion

Bioengineered kidney tubules: indoxyl sulfate excretion

Bioengineered kidney tubules: indoxyl sulfate excretion

Normal Albumin	Glycated Albumin	Reference
Native helical structure	Beta sheet rich structure, aggregation and formation of cross beta sheets.	Bouma et al. 2003, Obrenovich and Monnier 2004.
Drug binding	Impaired drug binding properties	Baraka-Vidot et al. 2012, Vetter and Indurthi, 2013, Awasthi et al. 2015b.
Fatty acid binding	Impaired fatty acid binding and transport	Yamazaki et al. 2005, Blache et al. 2015.
Antioxidant function	Loss of antioxidant function	Bourdon et al. 1999, Faure et al. 2008.
Esterase function	Loss of esterase activity	Ahmed et al. 2005, Baraka-Vidot et al. 2015.
Hormone transport	Impaired hormone transport	Watanabe et al. 1991, Petitpas et al. 2003.
Protective effect on cells (Endothelial cells, RBCs, Muscle cells etc.)	Deleterious effect on cells (cytotoxicity, inflammation, and membrane damage)	Amore et al. 1997, Hattori et al 2001, Awasthi et al 2015.

Bioengineered kidney tubules: indoxyl sulfate excretion

Bioengineered kidney tubules: indoxyl sulfate excretion

	Free IS	CKD-IS	HSA-IS
K_m (µM)	29.3	5.4	1.4
$CL_{int,u}$ (µL/min/10 ⁶ cells)	0.90	5.1	33.7

Albumin supports renal secretion of drugs and metabolic wastes

Bioengineered intestinal tubules

Extracellular Matrix

14 days Static

7 days flow

Epithelial barrier

Main small intestinal cell types present

Villi-like formation

Toxicology in Vitro 60 (2019) 1–11

Stem cells

Bioengineered intestinal tubules

Conclusions

- Bioengineered kidney proximal tubules **recapitulate** key epithelial features, suitable for **renal physiology**, **pharmacology** and **quantitative assessment** of tubular transport and mechanistic studies
- Similar approaches are used for **intestinal**, bile duct and liver tissue

Utrecht-Advanced *In Vitro* Models Hub

Utrecht-Advanced *In Vitro* Models Hub

- Many new, innovative *in vitro* models have significant potential to better predict human or animal physiology thereby replacing animal experimentation, but...
- development often stops after establishment due to:
 - lack of interest for implementation
 - lack of knowledge on validation
 - lack of funding

Utrecht-Advanced *In Vitro* Models Hub

- Aims to be a **leading centre of expertise** on development of *in vitro* models for diagnostics, models of disease, models for compound screening (chemical, pharmaceutical, food) and safety testing.
- Is a **one-stop shop** where high potential *in vitro* models are being developed, validated and transferred to industries and regulatory bodies.
- **Facilitates multidisciplinary collaborations** between academia, research institutes and industry, health care foundations and regulators.

Creating a center of expertise in Utrecht (U-AIM) for validation and valorization of advanced *in vitro* models with a strong focus on alternatives for animal experimentation is thus a timely investment.
